

Residential Roof Garden

Green roof system and landscape design

This garden has been designed for use by the residents of the apartment block.

In order to create the garden, an intensive green roof system will need to be installed. The system will allow enough water to be retained to ensure the health of the plants, but also allow free drainage of excess water. The green roof has multiple benefits including protection of the roof membrane, new habitats and increased biodiversity, and rainwater retention.

The scheme consists of a series of raised beds, planting with year round interest, and seating. The design has been created to enable residents to wander round the garden, relax and socialise.
